## RESEARCH INTERESTS

- Causal Inference, Survival Analysis, Longitudinal data analysis, and Pharmacoepidemiology.
- Evaluating causal effects of treatment in studies (randomized/target trials) with non-compliance
- Evaluating causal effects of treatment in studies with potentially informative missingness or censored data
- Assessing the implications of acute change in biomarkers on the effect of treatments on longer-term endpoints

## EDUCATION

**University of Utah School of Medicine**, Salt Lake City, UT

May 2025 (*Expected*)

Ph.D. Biostatistics (Population Health Sciences)

Dissertation

- **Effect Modification by Acute Change in a Biomarker: Impact of Acute GFR Change on the Effect of SGLT-2 inhibitors on Long-Term Endpoints in Kidney Trials:** Utilized principal stratification with a normal copula model, governed by the correlation between potential biomarker changes under treatment and placebo, to estimate conditional average treatment effects. The method aims to explore the impact of acute biomarker changes on treatment effect on long-term clinical endpoints in randomized clinical trials, addressing the challenge of analyzing treatment-biomarker interactions in the presence of post-randomization factors and situations where the conventional monotonicity assumption may oversimplify the complex biological realities faced in clinical settings. I illustrate the method by determining how knowledge of acute change in glomerular filtration rate modifies the expected effect of SGLT2 inhibitors on clinical endpoints in patients with chronic kidney disease.
- **Estimating Per-Protocol Effects in Emulated Target Trials with Competing Risks: ARBs vs. ACEIs on Cognitive Outcomes in SPRINT:** Developed a method for estimating per-protocol effects in time-to-event studies with competing risks by using the discrete-time counterfactual subdistribution (cumulative incidence) functions. I employed inverse probability weighting to address time-varying confounding, competing risks, adherence, and loss to follow-up. I apply this method to an emulated target trial investigating the effects of angiotensin-II receptor blockers (ARBs) versus angiotensin-converting enzyme inhibitors (ACEIs) on cognitive outcomes. Using data from the Systolic Blood Pressure Intervention Trial (SPRINT), the analysis incorporated IP-weighted risk ratios to assess the per-protocol effects, providing a rigorous evaluation of the comparative effectiveness of ARBs and ACEIs on the risk of mild cognitive impairment (MCI), probable dementia (PD), and all-cause mortality.

**Northern Arizona University**, Flagstaff, AZ

May 2020

M.S. Statistics (**With Distinction; Final CGPA: 4.00 / 4.00**)

**Kwame Nkrumah University of Science and Technology**, Kumasi, Ghana

June 2017

B.S. Statistics (**First Class Honors**)

HONORS, AWARDS & CERTIFICATES	<ul style="list-style-type: none"> <li>• Student Scholarship Award - Biopharmaceutical Section, American Statistical Association 2024</li> <li>• Graduate Statistician Accreditation - American Statistical Association July 2023 - Aug 2030</li> <li>• Lester R.
